                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- FUNCTION: CAN TRANSFORM NIH 3T3 CELLS. EXHIBITS STRONG MITOGENIC PUNCTION: CAN TRANSFORM (BY SIMILARITY).
-!- SUBSCELLULAR LOCATION: Extracellular.
-!- TISSUE SPECIFICITY: Embryos, adult muscles and adult testis.
-!- SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=90295275; PubMed=2193291;

-!- FUNCTION: MAY BE THE ENDOGENOUS RIDGE SIGNAL FOR LIMB DEVELOPMENT.

-!- FUNCTION: MAY BE THE ENDOGENOUS RIDGE SIGNAL FOR LIMB DEVELOPMENT.

BETTWERN SONIC HEDDEHOG (SHH) AND FGF4.

-!- TISSUE SPECIFICITY: POSTERIOR RIDGE.

-!- INDUCTION: By retinoic acid.

-!- SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBCELLULAR LOCATION: Secreted.

TISSUE SPECIFICITY: Glial cells.

PIN: Three molecular species were found (30 kDa, 29 kDa and 25 kDa), cleaved at Leu-4, Val-13 and Ser-34 respectively. The smaller ones might be products of proteolytic digestion.

Furthermore, there may be a functional signal sequence in the 30 kDa species which is uncleavable in the secretion step.

-1 FUNCTION: May have a role in glial cell growth and differentiation during development alloss during repair and regeneration of brain tissue after damage, differentiation and survival of neuronal cells, and growth stimulation of glial tumors.

-1 SUBSCELULIAR LOCATION: Secreted.

-1 TISSUE SPECIFICITY: Brain and kidney.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    34 SPHLGOSEAG-----GLPRG-----PAVTDLDHLKGILRRRQLYC----RTGFHLE

-1. FUNCTION: The heparin-binding growth factors are angiogenic agents in vivo and are potent mitogens for a variety of cell types in vitro. There are differences in the tissue distribution and concentration of these 2 growth factors.
                                                                                                                                                                                                                                                                                                                                               01-FEB-1994 (Rel. 28, Created)

J. Biol. Chem. 271:30263-30271(1996)
-!- FUNCTION: The heparin-binding growth factors are angiogenic agents in vivo and are potent mitogens for a variety of cell types in vitro. There are differences in the tissue distribution and concentration of these 2 growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE=90201563; PubMed=2318343;

--- TISSUE SPECIFICITY: Brain and testis; widely distributed in the developing nervous system. In adult, high levels in the granular layer of the cerebellum, less in hippocampus and olfactory bulb.
--- SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          26; Gaps

Biophys. Res. Commun. 243:148-152(1998).

-: FUNCTION: Induces heparcocallular proliferation. Has no biological effect on the heart (By similarity).

-: SUBCELIULAR LOCATION: Secreted (By similarity).

-: SUBCELIULAR Elongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25 ACQAHPIPDSSPLLQFGGQVRQRY-----LYTDDAQQTEAHLEIREDGTVGGAADQ-
In adult, most abundant in hippocampus. SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                 -!- SIMCIARAL LOCATION: Secreted (Potential).
-!- SIMCIBLIUMAR LOCATION: Secreted (Potential).
-!- SIMILARITY: Belongs to the heparin-binding growth factors family.
Huddleston K.A., Teliska M., Alfonso P., Florence C., Blunt A., Huddleston K.A., Teliska M., Alfonso P., Coleman T.A., Ornitz D.M., Dilon P.A., Duan R.D.;
"Cutaneous wound healing by keratinocyte growth factor 2.";
Submitted (JUL-1997) to the EMBL/GenBank/DBJ databases.
-!-FUNCTION: COULD BE A GROWTH FACTOR ACTIVE IN THE PROCESS OF WON
HEALING. ACTS AS A MITGGEN IN THE LUNG. MAY ACT IN A MANNER
SIMILAR TO FGF-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     POLY-SEK.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- SUBSCELLULAR LOCATION: Secreted (Potential).
-!- TISSUE SPECIFICITY: Expressed abundantly in embryos and the lung, and at much lower levels in brain and heart.
-!- SIMILARITY: Belongs to the heparin-binding growth factors family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21 GNYKKPKLLYCSNGGH---FLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVXIKSTETG 77
                                                                                               -1- SUBUNIT: Monomer.
-1- MISCELLANEOUS: This protein binds heparin, although less strongly than does DFGF.
                                                                                                                                                                                                                                                                                          -!- SIMILARITY: Belongs to the heparin-binding growth factors family.

Science 251:90-93(1991).
Science 251:90-93(1991).
-!- FUNCTION: The heparin-binding growth factors are angiogenic
-!- FUNCTION: The heparin-binding for a variety of cell types in vivo and are potent mitogens for a variety of cell types vitro. There are differences in the tissue distribution and concentration of these 2 growth factors.
                             SEQUENCE OF 1-18 FROM N.A. Philippe J.M., Renaud F., Desset S., Laurent M.; Submitted (JUL-1992) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HEPARIN (POTENTIAL)

                                                              patterning.
SUBCELIULAR LOCATION: Secreted.
SUBCELIULAR LOCATION: Baternal transcript is found mainly in the arisal hemisphere. Zygotic transcript is found around the blastopore and in the late gastrula stage, in the dorsal part. In later stages it is found along the dorsal part and head region. DEVELOPMENTAL STAGE: THE MATERNAL PROTEIN IS DETECTED UP TO THE BLASTULA STAGE BUT DECLINES BY THE BRALY GASTRULA. ZYGOTIC EXPRESSION STARTS AT AROUND EARLY GASTRULA; THE LEVEL OF EXPRESSION REACHED AT STAGE 15 PERSISTS DURING NEURULA AND TALLBUD STAGES, AND IS FURTHER INVERASED DURING THE TADPOLE STAGES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- PTM: Known to be glycosylated.

fibroblast growth factor 3 - zebra fish
Cispecies: Brachydanio rerio (zebra fish)
Cipate: 10-May-1996 #sequence_revision 19-Jul-1996 #text_change 16-Jul-1999
CiAccession: JC4627
Riklefer, P:; Straehle, U:; Dickson, C.
Rene 168, 211-215, 1996
A;Title: The zebrafish Fgf-3 gene: cDNA sequence, transcript structure and genomic organ
A;Reference number: JC4627; MUID:96194899; PMID:8654946
                                                                                                                                                                                                                                                                                                                     A, Molecule type: mRNA
A, Residues: 1-256 < KIE>
A, Cross-references: EMBL: Z48714; NID: 9971333; PIDN: CAA88596.1; PID: 9971334
A, Experimental source: embryo
A, Note: The authors translated the codon TGG for residue 178 as His
C, Comment: This factor belongs to the fibroblast growth factor family which have the fun otein is a cell signalling molecule and plays the roles during the early stages of devel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rjohmachi, S.; Matanabe, Y.; Mikami, T.; Kusu, N.; Ibi, T.; Akaike, A.; Itoh, N.
